

# Building Docker Containers Services

## Docker Compose - A Complete stack rollout

Docker defines Compose as:

“A Tool for defining and running **multi-container** Docker applications. With Compose, you use a **YAML** file to configure your application’s services. Then, with a single command, you create and start all the services from your configuration”

So basically...

Docker-compose provides the possibility of defining a **complex stack of Application** in a single file and running it with a single command

```
FROM ubuntu:latest
```

Webapp Container
